

Problem statement:

Currently the hospital has 4 members in the office with privilege of Super admin, Admin, Staff 1, Staff 2, Staff n (Can be expandable).

So, they're facing issues like there're multiple insurance companies which provides portal, mail, Courier etc. Options for admitting the Cashless claims. Also sometimes the claim got rejected from company and patient continues for reimbursement claim so they need to memorize it.

In cashless:

Which company follows which things like portal, mail, courier
patient preauth approved or not?

if pre auth approved then at the time of discharge, it's approved or rejected, if approved then proceed for settlement, if settlement then via which medium portal, mail or courier?

If settled then how much hospital discount is applied, how much deduct, how much TDS.

And after that how many amount need to be given to pharmacy and laboratory, radiology (flexible).

And after settled, patient need to be called for deposit return so need to check whether patient wants online or cash refund, patient coming when?, if returned then the claim should be closed.

If courier then when it sent to the company from the hospital, how much time it's taking and if it's more than 45-60 days, then it should send alert on admin dashboard to remind the payment.

Detailed reports in PDF (template of Hospital) and Excel files as well.

monthly and financial years wise reports of all field like patient names, their company, pharmacy, discount, paid, TDS, Laboratory, Radiology each and everything.

And Many more features as you suggest.

Reimbursement:

Patient come sometimes for query raised by company to him/her.

If it is little bit large then it takes 2-4 days for hospital to be completed, need to track the record of that also.

Workflow overview:

Patient comes -> if company matches then asked for documents, sent over the company for verification
-> pre auth approved or rejected.
-> if rejected -> Reconsider
-> still rejects -> claim closed with reason in remarks.

- ➔ If approved -> how much?
- ➔ Then on discharge day final bill making -> staff enters hospital total bill , pharmacy and laboratory (which will be included in hospital final bill).
- ➔ Sent for approval-> if rejected -> Reconsider –
- ➔ Still rejected -> closed with reasons in remarks.
- ➔ If approved? Then how much?
- ➔ Sent documents for settlement as We discussed above method.
- ➔ If settled? How much? If more deduct than patient deposit , red alert to call the patient
If less still call the patient but in yellow alert.
- ➔ How much is hospital discount, how much is pharmacy , lab, radiology etc.
Deposit returned -> Claim closed.

****Problem Statement****

The hospital currently manages insurance claims (both Cashless and Reimbursement) manually with a small team consisting of a Super Admin, Admin, and multiple Staff members (roles are expandable). This process is time-consuming, error-prone, and difficult to track due to the involvement of multiple insurance companies, each having different procedures, portals, communication channels (email, courier, portal), and documentation requirements.

Key Challenges

****Cashless Claims Process:****

- Multiple insurance companies use varied submission methods (portal, email, courier).
- Difficulty in tracking the complete lifecycle of each claim:
 - Pre-authorization status (Approved/Rejected).
 - Final approval at discharge.
 - Settlement status and mode (portal/email/courier).
 - Final settlement amount, hospital discount applied, deductions, TDS, etc.
- Coordination of payments to internal departments (Pharmacy, Laboratory, Radiology – flexible and expandable).
- Tracking and timely return of patient deposits (online or cash) after settlement.
- Delayed follow-ups on couriered documents, often exceeding 45–60 days.

****Reimbursement Claims:****

- Patients frequently approach the hospital for queries or additional documents raised by the insurance company.
- Manual tracking of such follow-ups, which can take 2–4 days or more.

****Reporting & Compliance:****

- Lack of structured, automated reports (monthly and financial year-wise) in both PDF (hospital-branded template) and Excel format, covering patient details, insurance company, discounts, TDS, departmental breakdowns (pharmacy, lab, radiology), etc.

****Overall Issues:****

- High dependency on individual staff memory.
- Risk of missed follow-ups and delayed payments.
- No centralized visibility or alerts for pending actions.
- Scalability issues as claim volume grows.

Proposed Solution Overview: Hospital Insurance Claims Management System

A web-based application that automates and streamlines the entire insurance claims workflow for both Cashless and Reimbursement cases, with role-based access control, real-time tracking, automated alerts, and comprehensive reporting.

Suggested Core Features

****1. User & Role Management****

- Super Admin, Admin, Staff (expandable roles with specific permissions).
- Audit logs for all actions.

****2. Insurance Company Management****

- Master database of all insurance companies with their:
 - Preferred submission method (Portal / Email / Courier).

- Portal login credentials (securely stored).
- TAT (Turn Around Time) norms.
- Contact persons and escalation matrix.

****3. Patient & Claim Registration****

- Link patient with insurance policy details (TPA/Insurance Company).
- Digital document upload and management (with version control).

****4. Cashless Claims Workflow****

- ****Pre-Authorization Module****: Status tracking (Pending/Approved/Rejected), with remarks and reconsideration workflow.
- ****Discharge & Final Approval****: Integration point for final bill, departmental breakup (Pharmacy, Lab, Radiology, etc.).
- ****Settlement Tracking****: Record approved amount, hospital discount, TDS, deductions, and net payable.
- ****Departmental Settlement****: Allocate and track payments to Pharmacy, Laboratory, Radiology, and other departments.
- ****Patient Deposit Management****: Track deposit taken, amount to be refunded, mode (Cash/Online), and scheduling of patient visit.
- ****Courier Management****: Record dispatch date, tracking number, expected TAT, and automated alerts on Admin dashboard if pending > 45/60 days.

****5. Reimbursement Claims Module****

- Track patient queries, additional documents required, and hospital response timeline.
- Status monitoring until final settlement.

****6. Alerts & Notifications****

- Dashboard alerts for:

- Pending pre-auth / final approval.
- Delayed courier submissions.
- Deposit refunds pending.
- Settlement vs. Deposit mismatch (Red alert if over-deducted, Yellow if under).
- Email/SMS/WhatsApp notifications (optional).

****7. Reports & Analytics****

- ****Detailed Reports**** (PDF with hospital branding + Excel export):
 - Patient-wise claim summary.
 - Insurance Company-wise performance.
 - Monthly & Financial Year-wise reports.
 - Department-wise revenue from claims (Pharmacy, Lab, Radiology, etc.).
 - Discount, TDS, and Deduction analysis.
 - Ageing analysis of pending claims.
- Custom filters and export options.

****8. Additional Recommended Features****

- ****Document Management System****: Secure storage, quick search, and expiry alerts for documents.
- ****Dashboard****: Real-time KPIs (Claims Pending, Approved, Settled, Rejected, Revenue Impact).
- ****Remarks & Communication Log****: Centralized notes for every stage of the claim.
- ****Patient Portal**** (optional future phase): Patients can check status and upload documents.
- ****TPA/Insurance Portal Integration**** (where APIs are available).
- ****Billing Integration****: Auto-pull final bill from existing Hospital Management System.
- ****Data Security & Compliance****: Role-based access, data encryption, backup, and audit trails.

- **Mobile App** (optional): For staff to update status on the go.
- **Claim Rejection Analytics**: Identify common rejection reasons and success rate per insurance company.
- **Financial Reconciliation**: Match settled amounts with actual bank receipts.

Expected Benefits

- Significant reduction in manual tracking and errors.
- Faster claim settlements and improved cash flow.
- Better coordination between hospital departments and patients.
- Professional, auditable process with complete visibility to management.
- Scalable solution that can grow with increasing patient volume and new insurance tie-ups.

This structured system will transform the current fragmented process into an efficient, transparent, and professional claims management workflow.

Would you like me to prepare a detailed **Software Requirements Specification (SRS)** document or a **feature prioritization** (MVP vs Phase 2) based on this?
